                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A method has been developed for screening for substances which inhibit CC the binding of TAKI polypeptide to TABI polypeptide. The method comparises: (a) contacting the polypeptide in the presence of a sample; and (b) detecting the amount of bound polypeptide, in which the sample can be pre-mixed with TAKI or TABI polypeptide first. The transforming CC growth factor (TGF) beta inhibitory substances can be used in drugs for cindications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement inhibitors or activators, or anoncyte migration inhibitors or activators, or physiological activity induction inhibitors or activators, or physiological activity induction inhibitors or activators, or precipitation inhibitors or activators, or miniphitors or activators, or precipitation inhibitors or activators, or anyloid beta protein precipitation inhibitors or activators, or anyloid beta protein the TAKI polypeptide function, particularly kinase can also be activity. The present sequence represents human TABI.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method for screening compounds for inhibition of inflammatory cytokine signal transduction by contacting the sample with TAKI and its receptor TABI and selecting for inhibition of TAKI/TABI binding. Also described is a method for screening compounds for inhibition of inflammatory cytokine signal transduction in which the inhibition of TAKI phosphorylation is selected for and drug compositions for the treatment of inflammatory disorders containing as active component an inflammatory cytokine signal transduction inhibitor. TAKI is an essential component of the signalling process which results in release of inflammatory cytokines such as interleukin-1 (IL-1), tumour mecrosis factor (TNF) and IL-6. The methods can be used for the selection of effective antiinflammatory agents. The present the present the presents human TAB-1, which is used in the exemplification of
This sequence represents the human TAB1 protein. The invention relates to a method for screening a the formation of a complex between XIAP and TAB1,

```
ö
inhibitor of apoptosis protein (XIAP), transforming growth factor-beta activated kinase I(TRAI) binding protein I(TABI) and a substance to be tested are contacted with each other and then the presence or formation of a complex between XIAP and TABI is detected. The substance can be used as a drug for extracellular matrix protein production enhancement, cell growth inhibition, monocyte migration, physiologically active substance induction, immunosuppression, and beta-amyloid protein deposition. A substance inhibiting the formation of a complex between TABI and XIAP as well as between XIAP and TGP-beta (Transforming growth factor-beta) type I receptor is useful as a drug.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A method has been developed for screening for substances which inhibit the binding of TAKI polypeptide to TABI polypeptide. The method comprises: (a) contacting the polypeptide in the presence of a sample, and (b) detecting the amount of bound polypeptide, in which the sample, can be pre-mixed with TAKI or TABI polypeptide first. The transforming growth factor (TGF)-beta inhibitors substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or extractlular matrix protein production enhancement inhibitors or activators, or cell proliferation prevention inhibitors or activators, or encored migration inhibitors or physiological activity induction inhibitors or activators, or immunosuppression inhibitors or activators, or activators, or immunosuppression inhibitors or activators, or amyloid beta protein
                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                   1 QSPTLTLQSTNTHTQSSSSSSGGLFRSRPAHSLPPGEDGRVEPYVDFAEFYRLWSVDHG 60

A method has been developed for screening for substances which inhibit the binding of TAXI polypeptide to TABI polypeptide. The method be comprises: (a) contacting the polypeptide in the presence of a sample; and (b) detecting the amount of bound polypeptide, in which the sample; and (b) detecting the amount of bound polypeptide, in which the sample; and be the marked with TAXI or TABI polypeptide first. The transforming growth factor (TQF) beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or activators, or activators, or activators, or activators, or inhibitors or activators, or inmunosuppression inhibitors or activators, or immunosuppression inhibitors or activators, or inhibitors of the TAXI polypeptide function, particularly kinase activators or activators.
                                                                                                                                            ò
precipitation inhibitors or activators, and such substances can also be inhibitors of the TAK1 polypeptide function, particularly kinase activity. The present sequence represents human TAB1.

                                                                                                                                                                                                                                                                                                         A method has been developed for screening for substances which inhibit the binding of TAKI polypeptide to TABI polypeptide. The method comprises: (a) contacting the polypeptide in the presence of a sample; and (b) detecting the amount of bound polypeptide, in which the sample; can be pre-mixed with TAKI or TABI polypeptide first. The transforming growth factor (TGF)-beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement inhibitors or activators, or cell poliferation prevention inhibitors or activators, or monocyte migration inhibitors or activators, or physiological activity induction inhibitors or activators, or myloid beta protein precipitation inhibitors or activators, or myloid beta protein precipitation inhibitors or activators, and such substances can also be inhibitors of the TAKI polypeptide function, particularly kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Best Local Similarity

                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences genomic DNA sequences (ABL16176-ABL30511), expressed DNA (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The piezent sequence lepterents the numean history piccein which is claimed in the invention. The invention comprises novel human comprises serine/threonine phosphatase (PSPase) polypeptides and polynebides and polynebides and polynebides of the invention may be used in the prevention (vaccine), diagnosis and treatment (gene therapy) of diseases associated with inappropriate PSPase expression. The PSPase polymedictiate PSPase expression in the prevention (vaccine) and any be used as DNA probes to detect and quantitate the presence of similar nucleic acids in samples. The PSPase polypeptides may be used as antigens in the production of antibodies against the PSPase polypeptides and in assays to identify modulators of PSPase expression and activity. The anti-PSPase antibodies and cativity. The anti-PSPase antibodies and cativity the anti-PSPase antibodies may also be used to down regulate expression and activity, the anti-PSPase antibodies may also be used as diagnostic agents for detecting the presence of PSPase polypeptides in samples. Disorders that may be prevented, diagnosed and/or treated by the invention are: immune/autoimmune disorders (e.g. Miscott-Aldrich syndrom, cleatak Higashi syndrome, Hashimoto's thyroiditis and multiple cleatise appendicitis and rheumacoid arthritis); cellular cardinate appendicitis and rheumacoid arthritis); cellular cardinate (e.g. lymphoma, lung and intestinal cancers); and
                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents the human HT48G64 protein which is claimed in the invention. The invention comprises novel human
Nucleic acids encoding serine/threonine phosphatase polypeptides, useful for preventing, diagnosing and/or treating, e.g. Crohn's disease, lung cancer and Scimitar syndrome -
                                                                                                                                                                                                                                                        Claim 11; Page 323-324; 335pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAU47075
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 12
                              Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by p. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelltis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The collections may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by conjugate linked immunosorbent assay (ELISA).

C. specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.
                                                                                                                                                                                                                                                                                                Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris -

CC polynucleotides are also used in diagnostics as expressed sequence tags (for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or (Quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating (II) are polypeptide and polynucleotide sequences have applications in (II) are useful for treating (II) and (II) are useful for treating (II) and (III) are useful for treating (II) and (III) are useful for treating (II) and (III) are useful for treating (II) are useful for treating (II) are useful for treating (II) and (III) are useful for treating (II) are useful for treating (III) are useful are useful for treating (III) are useful for treating (III

The Zmaxl and HBM genes have osteopathic activities. The genes can be used in gene therapy, antiesnse therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, pager's disease, scleroscosis, osteomalacia and fibrous dysplasia. ABA82038 to ABA82700 and AAG68168 to AAG68193 represent sequences used in the exemplification of the present invention.

This invention describes a novel human polynucleotide (I) which encodes a E3 ubiquitin protein ligase, h-E3 UPL (II). The products of the invention have antihitidamatory, immunosuppressive, neuroprotective, cytosetatic, chave antihitidamatory, immunosuppressive, neuroprotective, cytosetatic, attivital and cardiant activity. The products of the invention can also be used for treating cativity. The products mediated by the biological and/or pharmacological activity of h-E3 UPL. The nucleic acid sequences encoding E3 UPL are used in expression systems as assay for agonists and antagonists for the E3 UPL protein. The E3 UPL protein is used in screening assays to identify blockers and antagonists. They are also used in gene therapy. Specific modulation of biological and/or pharmacological activity of novel h-E3 UPL wis administration of a modulator or heterological activity of novel h-E3 UPL wis administration of a modulator or heterological activity of novel h-E3 (for treating physiological conditions like inflammation, autoimmune conting physiological conditions like inflammation, autoimmune disease, angiogenesis, cancer, hematopoietic disorders, archritis, cachexia, leukemia, pulmonary disorders, diabetes and viral infection. The analysis to map chromosomal location e3, screening tools association with disease markers. They are also used as screening tools

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Kankare K., Uusi-Oukari M., Janne O.A.;
submitted (JAN-1997) to the EMBL/GenBank/DDBJ databases.
-i-FUNCTION: BINDS TO, AND DESTBABILIZES, ORNITHINE DECARBOXYLASE
WHICH IS THEN DEGRADED. ALSO INHIBITS CELLULAR UPTAKE OF
POLYAMINES BY INACTIVATING THE POLYAMINE UPTAKE TRANSPORTER.
-i-MISCELLANEOUS: A RIBOSOMAL FRAMESHIFT OCCURS BETWEEN THE CODON
FOR SER-67 AND ASP-68. AN AUTOREGULATORY MECHANISM ENABLES
MODULATION OF FRAMESHIFTING ACCORDING TO THE CELLULAR
CONCENTRATION OF POLYAMINES.
                                                                         STRAIN=ATCC 11651 / B792;

MEDLINE=95272392; Pubmed=7752895;

HOyer L.L., Scherer S., Shatzman A.R., Livi G.P.;

"Candida albicans ALS1: domains related to a Saccharomyces sexual agglutinin separated by a repeating motif.";

Mol. Microbiol. 15:39-54 (1995).

-i- FUNCTION: MAY PLAY A ROLE IN ADHESION AND PATHOGENESIS.

-i- PTM: N-GLYCOSYLATED AND O-GLYCOSYLATED (POTENTIAL).

-i- SIMILARITY: TO YEAST SAG1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   P46590;

lant Mol. Biol. 29:353-365(1995).

-!- FUNCTION: REVERSIBLE HYDRATATION OF CARBON DIOXIDE.

-!- CATALYTIC ACTIVITY: H(2)CO(3) = CO(2) + H(2)O.

-!- SUBUNIT: HOMOHEXAMER (BY SIMILARITY).

-!- SUBUNIT: HOMOHEXAMER (BY SIMILARITY).

-!- SUBCELLULAR LOCATION. Cytoplasmic (Potential).

-!- DOMAIN: POSSESSES A TRANSIT-LIKE PEPTIDE, BUT IT IS PROPOSED THIS PETIDE IS NOT REMOVED AND THAT THEREFORE THE ENZYME STAY IN THE CYTOPLASM INSTEAD OF GOING TO THE CHLOROPLAST

(BY SIMILARITY).

-!- FUNCTION: THIS IS A RECEPTOR FOR THE ANTERIOR PITUITARY HORMONE PROLACTION, AS WELL AS PLACENTAL LACTOGEN I AND II.
-!- SUBCELLUIAL LOCATION: TYPE I membrane protein.
-!- ALTERNATIVE PRODUCTS: 3 ISOFORMS; PRL.RI, PRL.RZ AND PRL.R3 (SHCHEN); ARE PRODUCED BY ALTERNATIVE SPLICING.
-!- SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.
-!- SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
                                                                                                                                                                          STRAIN-Swiss Webster; TISSUE-Liver;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DB seq
